

Determining Interface from OBD-II Connector

Every vehicle manufactured since 1996 will have a 16-pin OBD-II connector that can be found within 1 meter (3 feet) of the steering wheel. The image below illustrates what the connector looks like.

You can determine which protocol is implemented by taking a look at the vehicle's OBD-II connector. All vehicles are required to have pins 4, 5, and 16. Pin 4 is the vehicle's chassis ground, pin 5 is the signal ground, and pin 16 is positive from the battery. In addition to pins 4, 5, and 16, the connector will have one or more pins. You can use the pin positions to determine which protocol is used on the vehicle.

PWM Must have the following pins: 4, 5, 16, 2, 10

VPW Must have the following pins: 4, 5, 16, 2 (**Note:** Not pin 10)

ISO Must have the following pins: 4, 5, 16, 7 (**Note:** Pin 15 is optional)

Confirmed Vehicle Protocols

The following list of vehicles have been reported as being compatible with ProScan. Please note, however, that we cannot guarantee the accuracy of this list.

Your vehicle does not have to be listed below in order to work with ProScan.

This list is only provided to help you determine which protocol your vehicle uses. If you order our ElmScan 5 interface, you need not worry about your vehicle's protocol, as the ElmScan 5 supports all OBD-II vehicles regardless of protocol.

Please see the section, "[Determining Interface from Connector](#)" in the ProScan User's Manual for more information regarding OBD-II compliance.
